In this definitive study, J. D. Hunley traces the program's development from Goddard's early rockets (and the German V-2 missile) through the Titan IVA and the Space Shuttle, with a focus on space-launch vehicles. Since these rockets often evolved from early missiles, he pays considerable attention to missile technology, not as an end in itself, but as a contributor to launch-vehicle technology. Focusing especially on the engineering culture of the program, Hunley communicates this very human side of technological development by means of anecdotes, character sketches, and case studies of problems faced by rocket engineers. He shows how such a highly adaptive approach enabled the evolution of a hugely complicated technology that was impressive—but decidedly not rocket science. Unique in its single-volume coverage of the evolution of launch-vehicle technology from 1926 to 1991, this meticulously researched work will inform scholars and engineers interested in the history of technology and innovation, as well as those specializing in the history of space flight. The HM-60 Vulcan engine is under development for Ariane 5 core stage application. It is a LO2LH2 gas generator cycle engine which develops a thrust of 1,075 kN (241,700 lb sub f) at vacuum conditions with a specific impulse of 4230 N*s/kg (431 lb sub f * sec/lbsub m). It is a step-thrust bipropellant engine which uses liquid oxygen as the oxidizer and RP-1 as the fuel. The engine operates on a gas generator cycle. Nominal sea level thrust is 1,800,000 lb(sub f) with step-thrust down to 75%. The step-thrust is obtained by oxidizer flow control on the gas generator. Includes list of replacement pages.
