This manual was  
written to provide  
technical  
information  
regarding the  
General  
Educational  
Development  
(GED') test as  
evidence that the  
GED' test is  
technically sound.  
Throughout this  
manual,  
documentation is  
provided regarding  
the development of  
the GED' test and  
data collection  
activities, as well as  
evidence of

reliability and  
validity. This  
manual is made up  
of 10 chapters: (1)  
Introduction to the  
GED' tests and an  
overview of the  
GED' testing  
program, including  
the purposes of the  
tests and proper  
uses of test scores;  
(2) The underlying  
theory of action for  
the GED' testing  
program and the  
framework for  
assessing validity;  
(3) The GED' test  
specifications and  
process for  
developing forms;  
(4) The  
standardization  
process, including  
the norming,  
scaling, and  
equating processes;  
(5) The standard-  
setting process for  
both the High  
School Passing  
Standard and GED'  
with Honors; (6)

Scoring processes for both machine- and human-scored test items; (7) The reliability of GED' test scores; (8) Accumulated evidence to support the validity argument; (9) Various accommodations for test-takers with disabilities; and (10) Supplemental materials for test preparation. This manual was written for anyone who is interested in (1) learning about the background of the GED' testing program, (2) understanding how the GED' test was developed and scored, (3) comprehending the statistical characteristics of the GED' test, or (4) knowing more, in general, about the

GED' testing program. The following are appended: (1) Reasoning through Language Arts Scoring Rubric; and (2) Social Studies Scoring Rubric. This Scoring Manual includes in-depth scoring instructions for many of the Wechsler Individual Achievement Test (4th ed.; WIAT-4) subtests, as well as instructions for conducting error analysis on the WIAT-4. It provides convenient access to the essential scoring information that is needed after an assessment is complete. "Information about the development and standardization of the Test of Integrated Language and

Literacy Skills (TILLS)"-- This manual describes Tonopah Test Range (TTR), defines its testing capabilities, and outlines the steps necessary to schedule tests on the Range. Operated by Sandia National Laboratories, TTR is a major test facility for DOE-funded weapon programs. The Range presents an integrated system for ballistic test vehicle tracking and data acquisition. Multiple radars, optical trackers, telemetry stations, a central computer complex, and combined landline/RF communications systems assure full Range coverage for

any type of test. Range operations are conducted by a department within Sandia's Field Engineering Directorate. While the overall Range functions as a complete system, it is operationally divided into the Test Measurements, Instrumentation Development, and Range Operations divisions. The primary function of TTR is to support DOE weapons test activities. Management, however, encourages other Government agencies and their contractors to schedule tests on the Range which can make effective use of its capabilities. Information

concerning Range use by organizations outside of DOE is presented. Range instrumentation and support facilities are described in detail. This equipment represents the current state-of-the-art and reflects a continuing commitment by TTR management to field the most effective tracking and data acquisition system available. Materials Testing provides the technical information necessary for military personnel to obtain samples and perform engineering tests and calculations on soils, bituminous paving mixtures, and concrete. These tests and

calculations are required to achieve proper design with soils, bituminous paving mixtures, and concrete and to achieve adequate control over their use in military construction. This manual covers soils, aggregates, bituminous cements, bituminous paving mixtures, portland cement concrete, and stabilized soil, including stabilizing agents (bitumens, cements, lime, fly ash, chemical modifiers). It gives detailed instructions for taking adequate representative test samples and step-by-step procedures for making physical-properties tests and for recording, calculating, and

evaluating test results. This manual explains methods for designing bituminous paving mixtures and stabilizing soil. It also gives the procedures and tests required to control the manufacturing of these mixtures. It describes the tools and equipment needed for performing tests and contains general instructions for the care, calibration, and use of test equipment. This manual is adopted for use by the United States Marine Corps (USMC), United States Navy (USN), United States Air

Force (USAF) personnel. Certain tests and procedures prescribed differ in principle or method and are more detailed than counterpart tests that are currently required by the U.S. Navy for new construction at Navy installations (including those in forward areas). The USMC engineer units perform field identification testing only. The USMC does not possess the tools or facilities required to perform the more deliberate laboratory tests described in parts of this publication. The test procedures and terminology

used in this manual conform to the latest methods and specifications of the American Society for Testing and Materials (ASTM), the American Concrete Institute, and the Portland Cement Association (PCA). The tests in this manual also apply to arctic construction. However, cold-weather effects present different problems and additional tests will be required for correct evaluation of the materials. These additional tests and considerations associated with arctic construction are in TM 5-349.
