The Complete Manual of Positional Chess Apr 14 2022 Russia boasts a long and rich tradition in chess education, and Russian chess teachers and trainers are simply the best in the world. The Complete Manual of Positional Chess, probably the most thorough grounding in the history of teaching chess, was recently created for chess teachers at the DYSS, the special sports school for young talents in Moscow. Konstantin Sakaev and Konstantin Landa present a complete set of instructions and tips for trainers and self-improvers. You will learn not only how to enhance your fundamental knowledge and technical skills, but also how to work on your physical and psychological conditioning. In VOLUME 2 you are again handed basic and advanced tools to improve in a wide array of areas: assessing and handling pawn structures, employing positional and tactical means to improve your position, identifying weak spots, mastering attacking dynamics and more. If you complete Sakaev and Landa's course you will be able to

assess virtually any chess position you are confronted with. With its all-encompassing approach this ground-breaking book allows everyone to reap the fruits of the long tradition of instructive excellence in Russia.

Manual Skills, Handedness, and the Organization of Language in the Brain Nov 09 2021 Whereas the cerebral specialization for skilled manual actions (praxis) seems closely linked to dominance for language, with both functions left lateralized in the vast majority of humans, the neural correlates of hand preference are still less well understood. Indeed, as a combination of inherited and non-inherited genomic factors (i.e., direct parental and concealed environmental contributions), handedness - in contrast to language - is less likely to have strong genetic indices and clearly lateralized functional organization. What about eye dominance, unimanual and bimanual object manipulation, and gestures, or attentional systems and the related egocentric or allocentric coding of space? Are these different categories functionally and structurally interconnected? Is their development and contribution to task performance linked, even if they are differently lateralized? How are they connected to language learning or its development? In trying to understand these relationships and their neural underpinnings we obtain a new insight into fundamental human behaviors, which depend either on shared or distinct cerebral resources that must, nevertheless, be harmonized by higher-order cerebral processing. In this Research Topic we assembled a dozen of original research contributions, as well as articles with more theoretically-driven perspectives, that directly speak to these issues. Hopefully this work will serve as a foundation for further discussions and will stimulate new research in this fascinating domain.
