History of Rotating Machinery Dynamics Dec 23 2019 This book starts with the invention of the wheel nearly 5000 years ago, and via Archimedes, Aristotle and Hero describes the first practical applications such as water wheels and grinding wheels, pushing on to more rigorous scientific research by inquiring minds such as Leonardo da Vinci and Copernicus in later ages. Newton and Leibniz followed, and beam structures received maximum attention three centuries ago. As focus shifts and related disciplines such as mathematics and physics also develop, slowly turbomachines and rotor and blade dynamics as we know the subject now take shape. While the book traces the events leading to Laval and Parsons Turbines, the emphasis is on rotor and blade dynamics aspects that pushed these turbines to their limits in the last century. The tabular and graphical methods developed in the pre-computer era have taken different form in the last fifty years through finite element methods. The methods evolved in the last century are discussed in detail to help modern day designers and researchers. This book will be useful to young researchers and engineers in industry and educational institutions engaged in rotor and blade dynamics work in understanding the past and the present developments and what is expected in future. Faculty and industry engineers can benefit from this broad perspective history in formulating their developmental plans.

A Shot At History Jun 09 2021 Abhinav Bindra once shot 100 out of 100 in practice six times in a row and walked out of the range unhappy. He is a perfectionist who once soled his shoes with rubber from Ferrari tyres because he thought it would help. He would wake up at 3 am to practise at his range at home if an idea suddenly struck him. It is from such obsession that greatness arrives. Abhinav Bindra's journey to become the first Indian to win an individual Olympic gold, and the first Indian to win a World Championship gold, is a story of single-minded passion. The Olympics has been an all-consuming journey for him ever since he was shattering beer bottles and glass ampoules in his garden in Chandigarh. No obstacle was too hard to overcome, no amount of practice too much, no experiment too futile and no defeat so severe that it made a comeback impossible. Shattered by his failure at the 2004 Athens Olympics when a gold medal seemed imminent, he changed as a shooter: from a boy who loved shooting, he became an athlete bent on redemption, a scientist who would try anything - from mapping his own brain to drinking yak milk to climbing rock walls - to win at the Beijing Olympics in 2008. His victory was not just a personal triumph, it was a gift to his nation, a breaking down of a sporting barrier that had stood for a century. Bindra's feat has taught his peers, and those yet to come, that an Olympic gold isn't an impossible dream. In ranges, on fields, in arenas, Indian athletes now own a new belief, they wear the knowledge that no challenge is beyond them. Helping to tell this remarkable story is sportswriter Rohit Brijnath, who collaborated with Bindra in producing this compelling autobiography of one of India's greatest sportsmen.

Structural Dynamics Apr 26 2020 The use of COSMOS for the analysis and solution of structural dynamics problems is introduced in this new edition. The COSMOS program was selected from among the various professional programs available because it has the capability of solving complex problems in structures, as well as in other engineering fields such as Heat Transfer, Fluid Flow, and Electromagnetic Phenomena. COSMOS includes routines for Structural Analysis, Static, or Dynamics with linear or nonlinear behavior (material nonlinearity or large displacements), and can be used most efficiently in the microcomputer. The larger version of COSMOS has the capacity for the analysis of structures modeled up to 64,000 nodes. This fourth edition uses an introductory version that has a capability limited to 50 nodes or 50 elements. This version is included in the supplement, STRUCTURAL DYNAMICS USING COSMOS 1. The sets of educational programs in Structural Dynamics and Earthquake Engineering that accompanied the third edition have now been extended and updated. These sets include programs to determine the response in the time or frequency domain using the FFT (Fast Fourier Transform) of structures modeled as a single oscillator. Also included is a program to determine the response of an inelastic system with elastoplastic behavior and a program for the development of seismic response spectral charts. A set of seven computer programs is included for modeling structures as two-dimensional and three dimensional frames and trusses.
