HPASS (Heat Pump district heating ASSESSment) is a computer program for assessment of district heating and cooling with heat pumps. The software facilitates comparison of site- and source-energy use, discounted payback, and life-cycle costs of these systems with alternative systems providing similar

services. The program also performs parametric studies of these analyses. This report explains the use of HPASS; the input requirements, available outputs, and program options are described. "The CPAC(Centrifugal Pump Analysis Code) is a one-dimensional meanline pump analysis code which predicts performances of centrifugal pumps at design and off-design conditions based on pump geometries and operating conditions. The PC version of the CPAC is based on Loss Isolation Code (LSISO) which was written in the early 1970s for NASA Lewis Research Center and the code developed previously at RIT which runs on VAX/VMS environment. This new version of CPAC is written with Visual Basic Programming language to work on personal computers. CPAC is a menu-driven and userfriendly code with online help manual. The following enhancements were made over previously existing codes Additional features: * Additional pump elements * Nodes based modeling scheme * Individual or multiple elements analysis * Constants or variable fluid properties * English or SI unit input/output * User-friendly interface incorporating - various input options - on-screen input editing - graphical and tabular output displays - graphical and tabular

print-outs * Personal computer based software * Reusability of the code Along with online help and the user's manual for program usage make the PC version CPAC a versatile tool for centrifugal turbopump design performance prediction and evaluation. It also offers the capability of predicting other pump configurations such as vaneless diffuser pumps, vaned diffuser pumps, volute pumps, single and multistage pumps, including the crossover elements (turning channel and downcomer) Comparisons of the CPAC predictions to experimental test data for several turbopumps and industrial pumps over a wide range of pump operating speed and flow rates were made, and the results were acceptable as a performance prediction code."--Abstract. The Seasonal Performance Model (SPM) was developed to provide an accurate source of seasonal energy consumption and cost predictions for the evaluation of heat pump design options. The program uses steady state heat pump performance data obtained from manufacturers' or Computer Simulation Model runs. The SPM was originally developed in two forms - a cooling model for central air conditioners and heat pumps and a heating model for heat pumps. The original models

have undergone many modifications, which are described, to improve the accuracy of predictions and to increase flexibility for use in parametric evaluations. Insights are provided into the theory and construction of the major options, and into the use of the available options and output variables. Specific investigations provide examples of the possible applications of the model.

(LEW). The piping in a liquid rocket can assume complex configurations due to multiple tanks, multiple engines, and structures that must be piped around. The capability to handle some of these complex configurations have been incorporated into the ADMIT code. The capability to modify the input on line has been implemented. The configurations allowed include multiple tanks, multiple engines, the splitting of a pipe into unequal segments going to different (or the same) engines. This program will handle the following type elements: straight pipes, bends, inline accumulators, tuned stub accumulators, Helmholtz resonators, parallel resonators, pumps, split pipes, multiple tanks, and multiple engines. Full color. A method for the design and costing of a metal hydride heat pump for residential use and a computer program, HYCSOS, which automates that method are described. The system analyzed is one in which a metal hydride heat pump can provide space heating and space cooling powered by energy from solar collectors and electric power generated from solar energy. The principles and basic design of the system are presented, and the computer program is described giving detailed design and performance equations used in the program. The operation of the program is explained, and a sample run is presented. This computer program is part of an effort to design, cost, and evaluate a hydride heat pump for residential use. The computer program is written in standard Fortran IV and was run on a CDC Cyber 74 and Cyber 174 computer. A

listing of the program is included as an appendix. This report is Volume 1 of a two-volume document. In a clear and concise style, the extensively revised *Putting Your Patients on the Pump* offers physicians, nurse practitioners, physician assistants, clinicians, and educators experience and practical guidance on how to help patients successfully manage their diabetes using an insulin pump. Ten chapters provide an in-depth description of insulin pump therapy advantages and disadvantages, pump and infusion set options and selection, pump candidate basics, getting the patient ready, pump start-up, pump therapy management, other considerations (e.g., dining out, alcohol, exercise and physical activity, intimacy, managing sick days, stress, travel, weight change, menses and menopause, pregnancy, pediatrics, and older patients), resources, tips from pump experts, and insulin pumps of the future. In 1996 the Institute of Medicine launched the

Quality Chasm Series, a series of reports focused on assessing and improving the nation's quality of health care. Preventing Medication Errors is the newest volume in the series. Responding to the key messages in earlier volumes of the series—“To Err Is Human (2000), Crossing the Quality Chasm (2001), and Patient Safety (2004)—this book sets forth an agenda for improving the safety of medication use. It begins by providing an overview of the system for drug development, regulation, distribution, and use. Preventing Medication Errors also examines the peer-reviewed literature on the incidence and the cost of medication errors and the effectiveness of error prevention strategies. Presenting data that will foster the reduction of medication errors, the book provides action agendas detailing the measures needed to improve the safety of medication use in both the short- and long-term. Patients, primary health care providers, health care organizations, purchasers of group health care, legislators, and those affiliated with providing medications and medication-related products and services will benefit from this guide to reducing medication errors. There are no two ways about it:
